

On Monday, we had a visit from the Minibeast Roadshow. We were allowed to hold most of the creatures, but not the tarantula because she is too fragile. The children asked some very good questions about how these animals moved and what they eat.

The giant African snails were called Gary and Michelle. They left a slimey trail on your hand!

The giant millipede was Millicent. Her legs felt like a wirey hairbrush walking across your hand.

We found out that the tarantula sheds her entire outer skeleton every time she grows.

The lizard stuck out his tongue to eat the mealworms and the snake was very squirmy!
